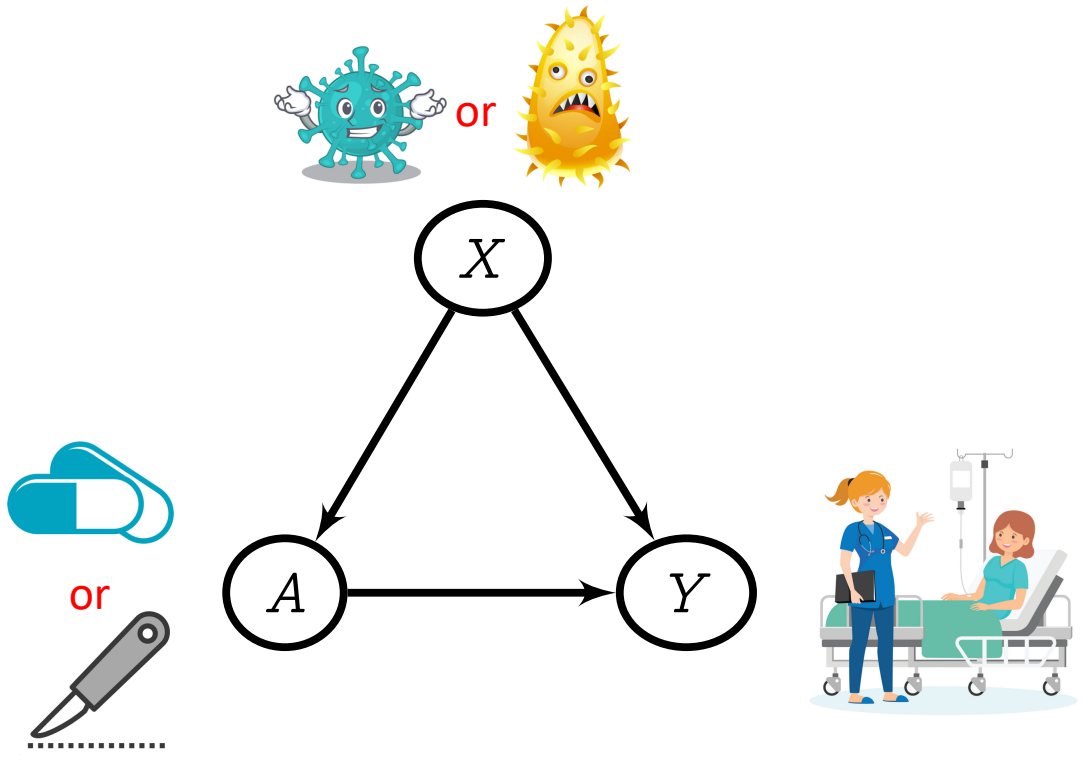
Observation vs intervention

Conditioning from observation: $\mathbb{E}[Y|A=a] = \sum_x \mathbb{E}[Y|a,x]p(x|a)$

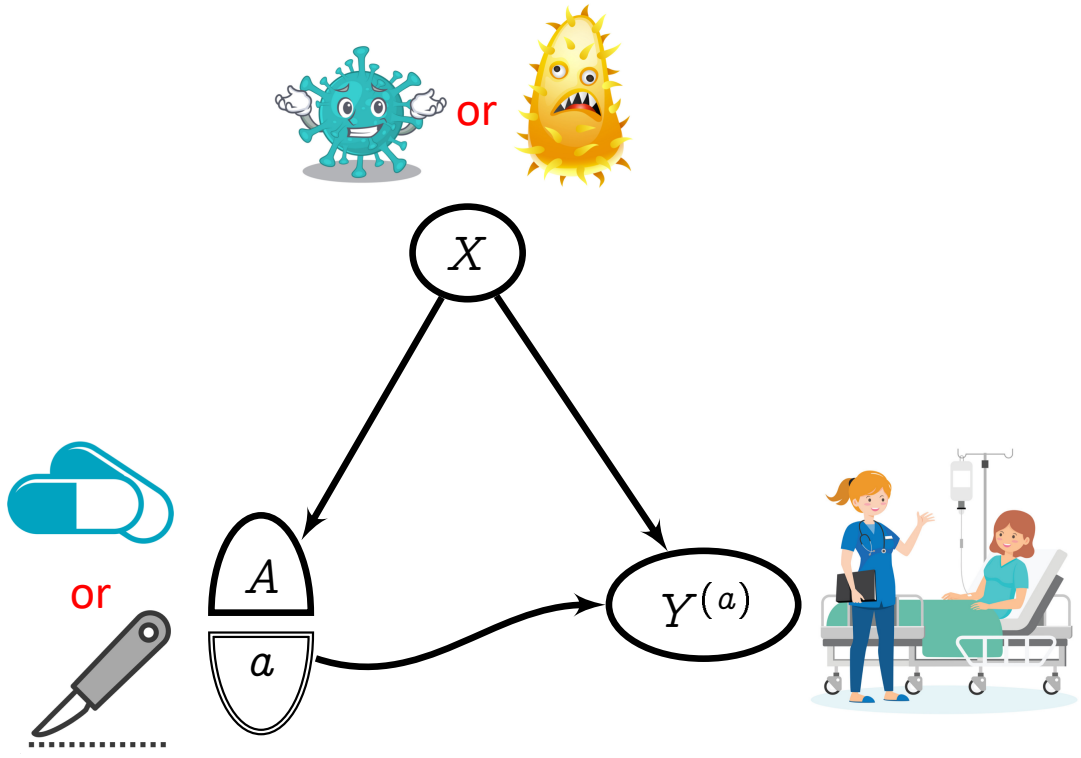


From our *observations* of historical hospital data:

- $P(Y = \text{cured}|A = \text{pills}) = 0.85$
- $P(Y = \text{cured}|A = \text{surgery}) = 0.72$

Observation vs intervention

Average causal effect (intervention): $\mathbb{E}[Y^{(a)}] = \sum_x \mathbb{E}[Y|a,x]p(x)$



From our *intervention* (making all patients take a treatment):

- $P(Y^{(\text{pills})} = \text{cured}) = 0.64$
- $P(Y^{(\text{surgery})} = \text{cured}) = 0.75$

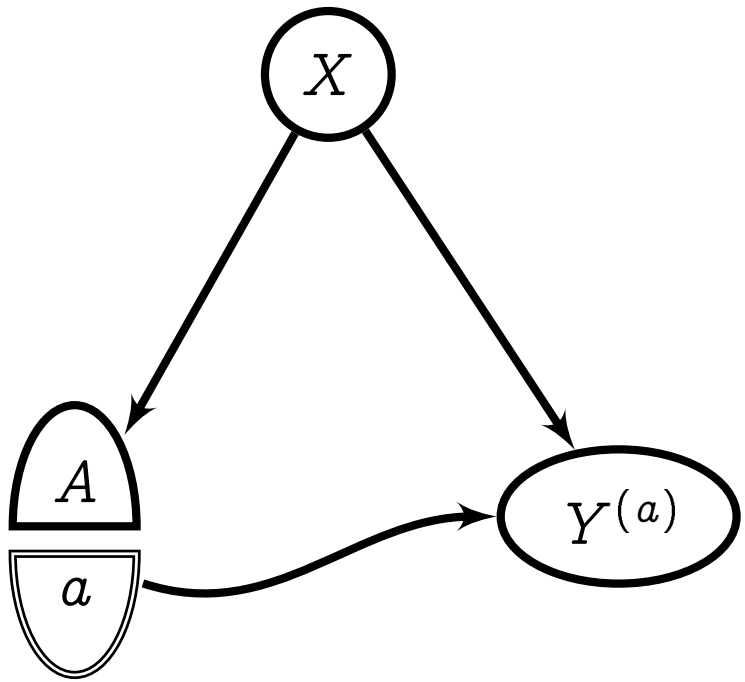
Questions we will solve



Outline

Causal effect estimation, observed covariates:

- Average treatment effect (ATE), *conditional* average treatment effect (CATE)

Causal effect estimation, hidden covariates:

- ... instrumental variables, proxy variables

What's new? What is it good for?

- Treatment A, covariates X, etc can be multivariate, complicated...
- ...by using kernel or adaptive neural net feature representations

Model assumption: linear functions of features

All learned functions will take the form:

$$\gamma(x) = \gamma^\top \varphi(x) = \langle \gamma, \varphi(x) \rangle_{\mathcal{H}}$$

Model assumption: linear functions of features

All learned functions will take the form:

$$\gamma(x) = \gamma^\top \varphi(x) = \langle \gamma, \varphi(x) \rangle_{\mathcal{H}}$$

Option 1: Finite dictionaries of learned neural net features $\varphi_\theta(x)$ (linear final layer γ)

Xu, G., A Neural mean embedding approach for back-door and front-door adjustment. (ICLR 23)

Option 2: Infinite dictionaries of fixed kernel features:

$$\langle \varphi(x_i), \varphi(x) \rangle_{\mathcal{H}} = k(x_i, x)$$

Kernel is feature dot product.

Model fitting: *neural* ridge regression

Learn $\gamma_0(x) := \mathbb{E}[\,Y|X = x]$ from features $\varphi_\theta(x_i)$ with outcomes y_i:

$$\hat{\gamma} \quad = \quad \arg\min_{\gamma \in \mathcal{H}} \left(\sum_{i=1}^{n} \left(y_i - \gamma^\top \varphi_\theta(x_i) \right)^2 + \lambda \|\gamma\|^2 \right) \tag{1}$$

Model fitting: *neural* ridge regression

Learn $\gamma_0(x) := \mathbb{E}[\,Y|X = x]$ from features $\varphi_\theta(x_i)$ with outcomes y_i:

$$\hat{\gamma} \quad = \quad \arg\min_{\gamma \in \mathcal{H}} \left(\sum_{i=1}^{n} \left(y_i - \gamma^\top \varphi_\theta(x_i) \right)^2 + \lambda \|\gamma\|^2 \right) \tag{1}$$

Solution for linear final layer γ:

$$\hat{\gamma} = C_{YX}^{(\theta)} (\, C_{XX}^{(\theta)} + \lambda)^{-1}$$

$$C_{YX}^{(\theta)} = \frac{1}{n} \sum_{i=1}^{n} [y_i \, \varphi_\theta(x_i)^\top]$$

$$C_{XX}^{(\theta)} = \frac{1}{n} \sum_{i=1}^{n} [\varphi_\theta(x_i) \, \varphi_\theta(x_i)^\top]$$

$$\hat{\gamma} \quad = \quad \arg\min_{\gamma \in \mathcal{H}} \left(\sum_{i=1}^{n} \left(y_i - \gamma^\top \varphi_\theta(x_i) \right)^2 + \lambda \|\gamma\|^2 \right) \tag{1}$$

Solution for linear final layer γ:

$$\hat{\gamma} = C_{YX}^{(\theta)} (\, C_{XX}^{(\theta)} + \lambda)^{-1}$$

$$C_{YX}^{(\theta)} = \frac{1}{n} \sum_{i=1}^{n} [y_i \, \varphi_\theta(x_i)^\top]$$

$$C_{XX}^{(\theta)} = \frac{1}{n} \sum_{i=1}^{n} [\varphi_\theta(x_i) \, \varphi_\theta(x_i)^\top]$$

How to solve for θ:

Substitute $\hat{\gamma}$ into (1), backprop through Cholesky for θ.

Model fitting: *kernel* ridge regression

Learn $\gamma_0(x) := \mathbb{E}[\,Y|X = x]$ from features $\varphi(x_i)$ with outcomes y_i:

$$\hat{\gamma} \quad = \quad \arg\min_{\gamma \in \mathcal{H}} \left(\sum_{i=1}^{n} (y_i - \langle \gamma, \varphi(x_i) \rangle_{\mathcal{H}})^2 + \lambda \|\gamma\|_{\mathcal{H}}^2 \right).$$

Model fitting: *kernel* ridge regression

Learn $\gamma_0(x) := \mathbb{E}[\,Y|X = x]$ from features $\varphi(x_i)$ with outcomes y_i:

Infinite dimensional solution at x:

$$\hat{\gamma}(x) = C_{YX}(C_{XX} + \lambda)^{-1}\varphi(x)$$

$$C_{YX} = \frac{1}{n}\sum_{i=1}^{n}[y_i\, \varphi(x_i)^\top]$$

$$C_{XX} = \frac{1}{n}\sum_{i=1}^{n}[\varphi(x_i)\, \varphi(x_i)^\top]$$

Model fitting: *kernel* ridge regression

Learn $\gamma_0(x) := \mathbb{E}[Y|X = x]$ from features $\varphi(x_i)$ with outcomes y_i:

$$\hat{\gamma} \quad = \quad \arg\min_{\gamma \in \mathcal{H}} \left(\sum_{i=1}^{n} (y_i - \langle \gamma, \varphi(x_i) \rangle_{\mathcal{H}})^2 + \lambda \|\gamma\|_{\mathcal{H}}^2 \right).$$

Kernel solution at x
(as weighted sum of y)

$$\hat{\gamma}(x) = \sum_{i=1}^{n} y_i \beta_i(x)$$

$$\beta(x) = (K_{XX} + \lambda I)^{-1} k_{Xx}$$

$$(K_{XX})_{ij} = k(x_i, x_j) = \langle \varphi(x_i), \varphi(x_j) \rangle_{\mathcal{H}}$$

$$(k_{Xx})_i = k(x_i, x)$$

Average treatment effect

Potential outcome (intervention):

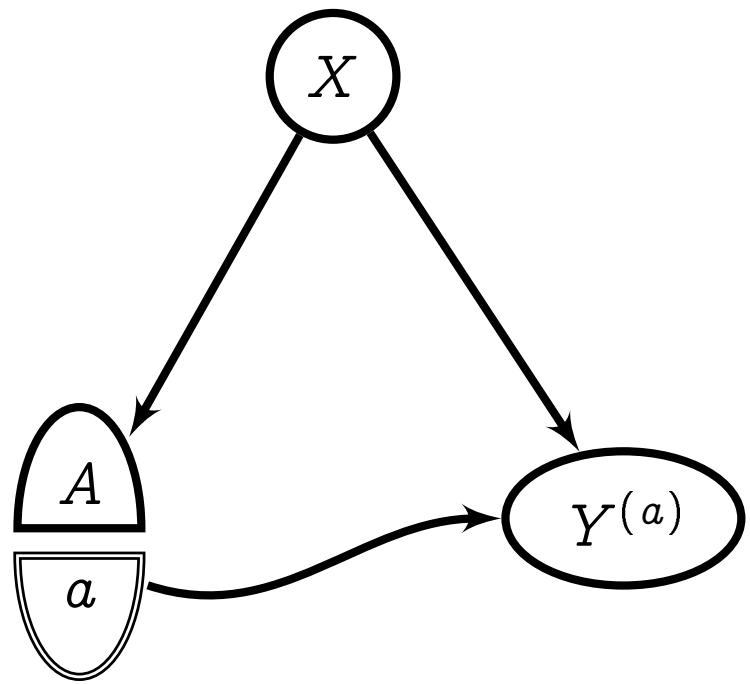
$$\mathbb{E}[Y^{(a)}] = \int \mathbb{E}[Y|a,x]\,dp(x)$$

(the average structural function; in epidemiology, for continuous a, the dose-response curve).

Assume: (1) Stable Unit Treatment Value Assumption (aka "no interference"), (2) Conditional exchangeability $Y^{(a)} \perp\!\!\!\perp A|X$. (3) Overlap.

Example: US job corps, training for disadvantaged youths:

- A: treatment (training hours)
- Y: outcome (percentage employment)
- X: covariates (age, education, marital status, ...)



Multiple inputs via products of kernels

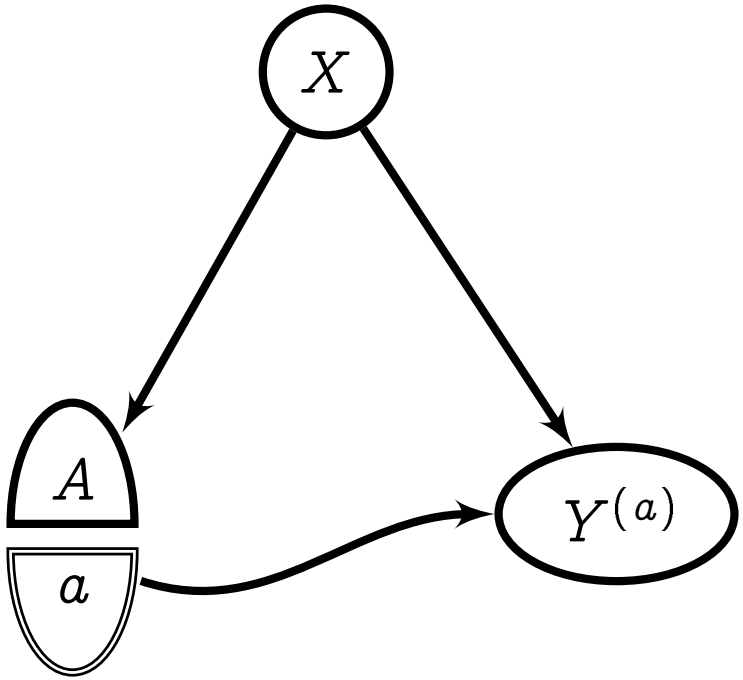
We may predict expected outcome from two inputs

$$\gamma_0(a, x) := \mathbb{E}[\, Y \,|\, a, x]$$

Assume we have:

- covariate features $\varphi(x)$ with kernel $k(x, x')$
- treatment features $\varphi(a)$ with kernel $k(a, a')$

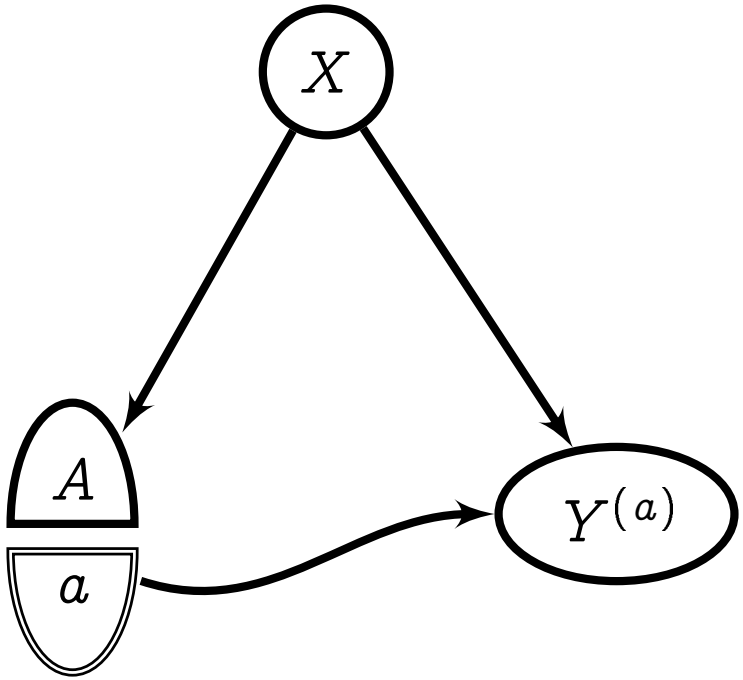
(argument of kernel/feature map indicates feature space)



Multiple inputs via products of kernels

We may predict expected outcome from two inputs

$$\gamma_0(a, x) := \mathbb{E}[\, Y \,|\, a, x]$$



Assume we have:

- covariate features $\varphi(x)$ with kernel $k(x, x')$
- treatment features $\varphi(a)$ with kernel $k(a, a')$

(argument of kernel/feature map indicates feature space)

We use outer product of features ($\implies$ product of kernels):

$$\phi(x, a) = \varphi(a) \otimes \varphi(x) \qquad \mathfrak{K}([a, x], [a', x']) = k(a, a')k(x, x')$$

Multiple inputs via products of kernels

We may predict expected outcome from two inputs

$$\gamma_0(a, x) := \mathbb{E}[\, Y \,|\, a, x]$$

$$\phi(x, a) = \varphi(a) \otimes \varphi(x) \qquad \mathfrak{K}([a, x], [a', x']) = k(a, a')k(x, x')$$

Ridge regression solution:

$$\hat{\gamma}(x, a) = \sum_{i=1}^{n} y_i \beta_i(a, x), \quad \beta(a, x) = [K_{AA} \odot K_{XX} + \lambda I]^{-1} K_{Aa} \odot K_{Xx}$$

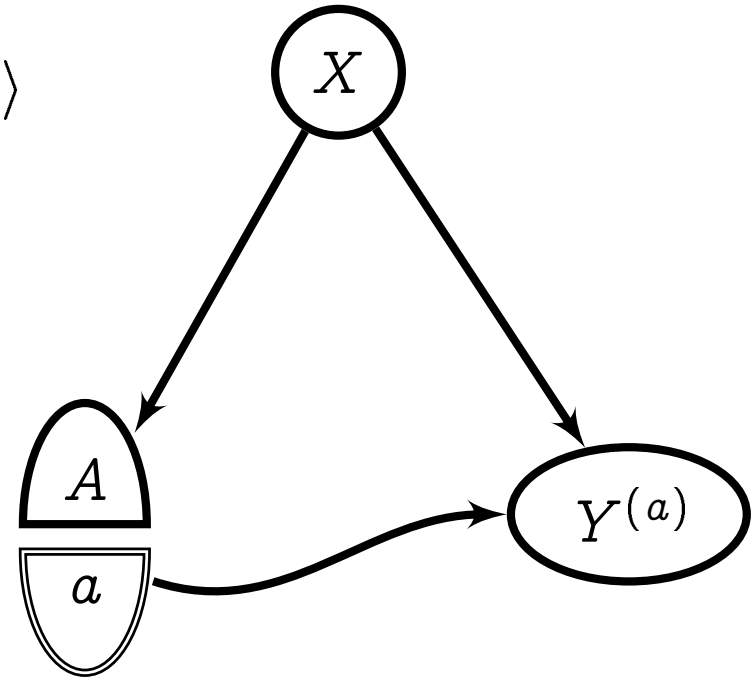
ATE (dose-response curve)

Well-specified setting:

$$\mathbb{E}[\,Y\,|\,a,x] =: \gamma_0(a,x) = \langle \gamma_0, \varphi(a) \otimes \varphi(x) \rangle$$

ATE as feature space dot product:

$$\begin{aligned} \mathrm{ATE}(a) &= \mathbb{E}[\gamma_0(a,X)] \\ &= \mathbb{E}\left[\langle \gamma_0, \varphi(a) \otimes \varphi(X) \rangle\right] \end{aligned}$$



ATE (dose-response curve)

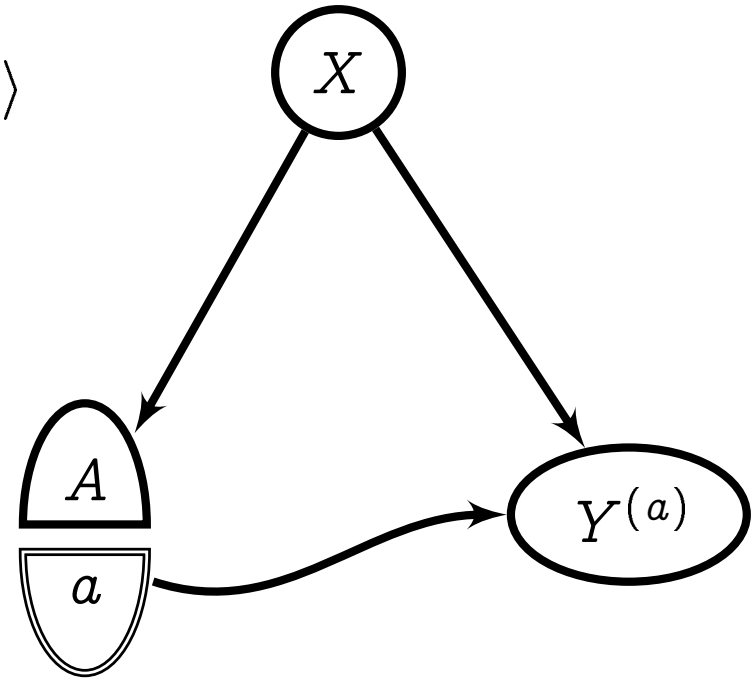
$$\begin{aligned} \mathrm{ATE}(a) &= \mathbb{E}[\gamma_0(a,X)] \\ &= \mathbb{E}\left[\langle \gamma_0, \varphi(a) \otimes \varphi(X) \rangle\right] \\ &= \langle \gamma_0, \varphi(a) \otimes \underbrace{\mu_X}_{\mathbb{E}[\varphi(X)]} \rangle \end{aligned}$$



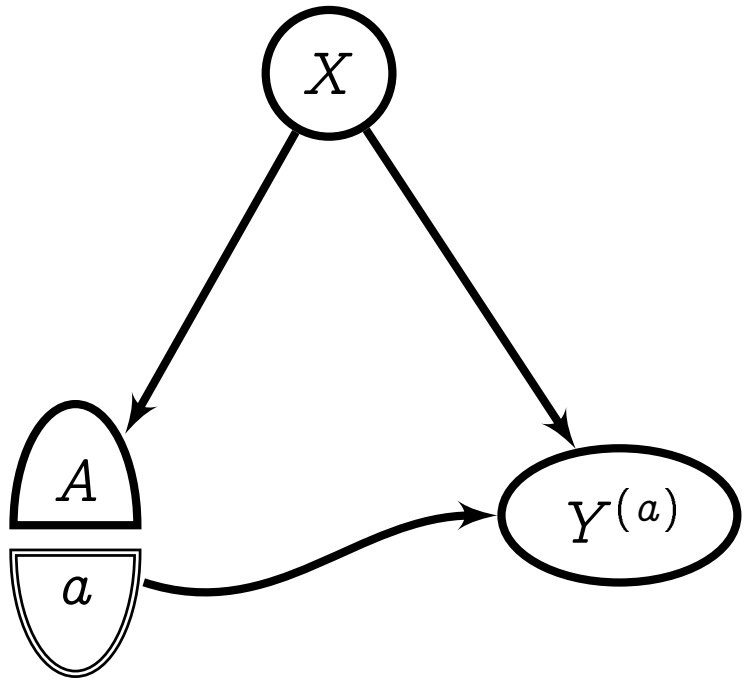
Feature map of probability $P(X)$,

$$\mu_X = [\ldots \mathbb{E}\left[\varphi_i(X)\right] \ldots]$$

ATE: example

US job corps: training for disadvantaged youths:

- X: covariate/context (age, education, marital status, ...)
- A: treatment (training hours)
- Y: outcome (percent employment)



Empirical ATE:

$$\widehat{\mathrm{ATE}}(a) = \widehat{\mathbb{E}}\left[\langle \hat{\gamma}_0, \varphi(X) \otimes \varphi(a) \rangle\right]$$

$$= \frac{1}{n} \sum_{i=1}^{n} Y^\top (K_{AA} \odot K_{XX} + n\lambda I)^{-1} (K_{Aa} \odot K_{Xx_i})$$

Application of IV: reinforcement learning

Q value is a minimizer of Bellman loss

$$\mathcal{L}_{\text{Bellman}} = \mathbb{E}_{SAR}\left[\left(R + \gamma[\mathbb{E}\left[Q^{\pi}(S', A')|S, A\right] - Q^{\pi}(S, A)\right)^2\right].$$

Corresponds to "IV-like" problem

$$\mathcal{L}_{\text{Bellman}} = \mathbb{E}_{YZ}\left[\left(Y - \mathbb{E}[f(X)|Z]\right)^2\right]$$

with

$$\begin{aligned} Y &= R, \\ X &= (S', A', S, A) \\ Z &= (S, A), \\ f_0(X) &= Q^{\pi}(s, a) - \gamma Q^{\pi}(s', a') \end{aligned}$$

...but seriously, what if there are hidden confounders?

We record symptom W, not disease X

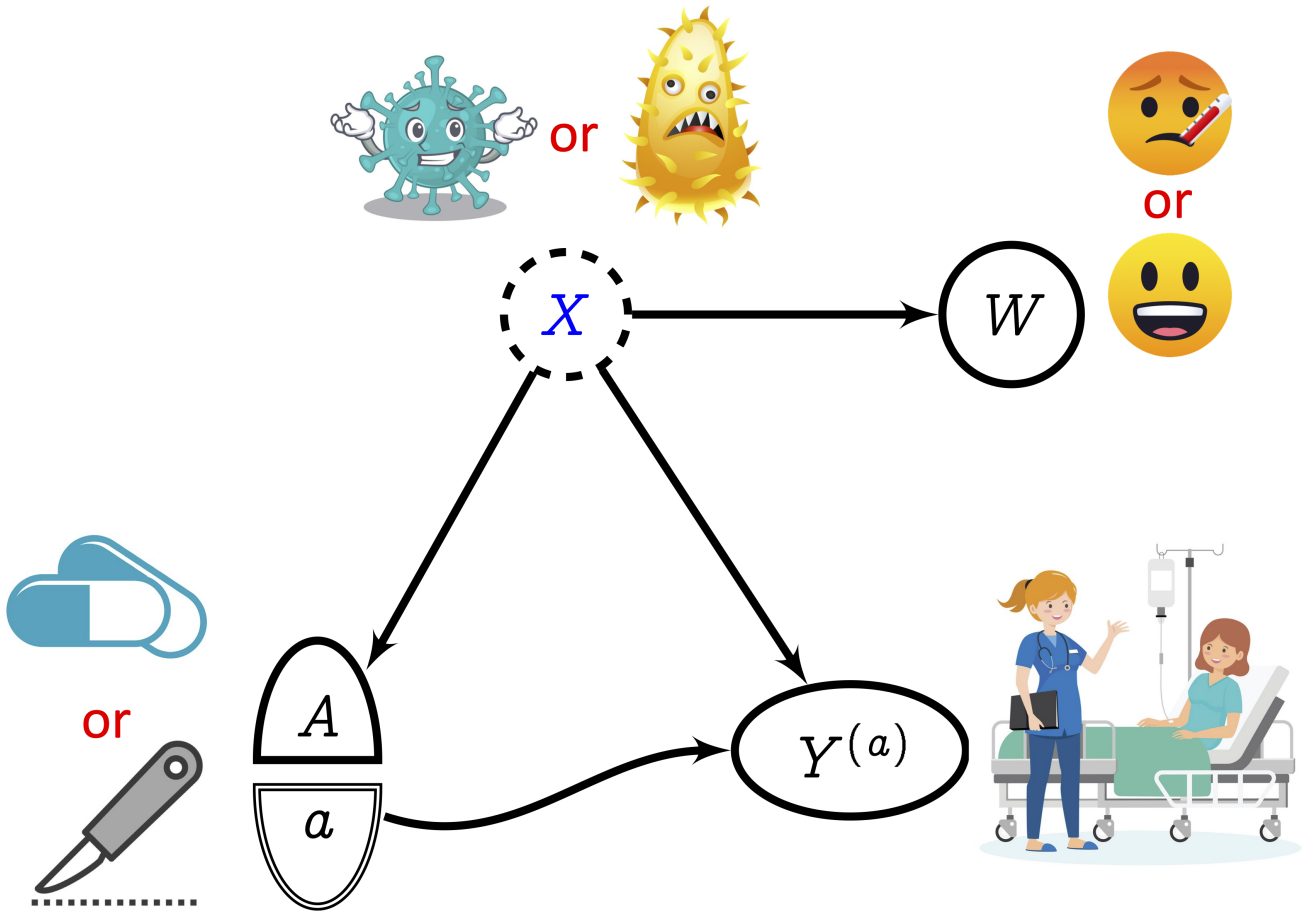
Could we just write: $P(Y^{(a)}) \stackrel{?}{=} \sum_{w \in \{0,1\}} \mathbb{E}[Y|a,w]p(w)$

We record symptom W, not disease X



Wrong recommendation made:

- $\sum_{w\in\{0,1\}} \mathbb{E}[\text{cured}|\text{pills}, w]p(w) = 0.8 \quad (\neq 0.64)$
- $\sum_{w\in\{0,1\}} \mathbb{E}[\text{cured}|\text{surgery}, w]p(w) = 0.73 \quad (\neq 0.75)$

Correct answer impossible without observing X

Road map: NN proxy learning

We'll proceed as follows:

- Proxy relation for continuous variables
- Loss function for deep proxy learning
- Define primary (ridge) regression with this loss
- Define secondary (ridge) regression as input to primary

Proxy relation, general domains

If X were observed, we would write (dose-response curve)

$$\mathbb{E}(Y^{(a)}) = \int_x \mathbb{E}(Y|a,x)p(x)\,dx.$$

....but we do not observe X.

Proxy relation, general domains

If X were observed, we would write (dose-response curve)

$$\mathbb{E}(Y^{(a)}) = \int_x \mathbb{E}(Y|a,x)p(x)dx.$$

....but we do not observe X.

Main theorem: Assume we solved for link function:

$$\mathbb{E}(Y|a,z) = \mathbb{E}_{W|a,z} h_y(W,a)$$

- "Primary" $\mathbb{E}(Y|a,z)$, "secondary" $\mathbb{E}_{W|a,z}$ linked by h_y
- All variables observed, X not seen *or modeled*.

Fredholm equation of first kind. Link existence requires $\diamondsuit$, identification of ATE requires $\triangle$ (and further technical assumptions) [XKG: Asspumption 2, Prop. 1,Corr. 1; Deaner]

$$\mathbb{E}[f(X)|A=a, Z=z] = 0,\ \forall(z,a) \iff f(X) = 0,\ \mathbb{P}_X \text{ a.s.} \quad \triangle$$

$$\mathbb{E}[f(X)|A=a, W=w] = 0,\ \forall(w,a) \iff f(X) = 0,\ \mathbb{P}_X \text{ a.s.} \quad \diamondsuit$$

Proxy relation, general domains

If X were observed, we would write (dose-response curve)

$$\mathbb{E}(Y^{(a)}) = \int_x \mathbb{E}(Y|a,x)p(x)dx.$$

....but we do not observe X.

- "Primary" $\mathbb{E}(Y|a,z)$, "secondary" $\mathbb{E}_{W|a,z}$ linked by h_y
- All variables observed, X not seen *or modeled*.

Dose-response curve via $p(w)$:

$$\mathbb{E}(Y^{(a)}) = \int_w h_y(a,w)p(w)dw$$

Proxy relation, general domains

If X were observed, we would write (dose-response curve)

$$\mathbb{E}(Y^{(a)}) = \int_x \mathbb{E}(Y|a,x)p(x)dx.$$

- All variables observed, X not seen *or modeled*.

Dose-response curve via $p(w)$:

$$\mathbb{E}(Y^{(a)}) = \int_w h_y(a,w)p(w)dw$$

Challenge: need a loss function for h_y

Primary loss function for $h_y(w, a)$

Goal:

$$\mathbb{E}(Y|a, z) = \mathbb{E}_{W|a,z} h_y(W, a)$$

Primary loss function:

NN for link $h_y(a, w)$

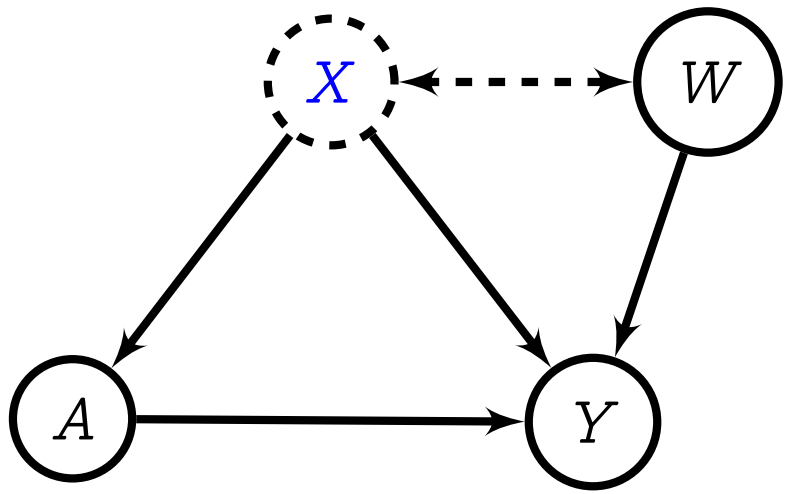
The link function is a function of two arguments

$$h_y(a, w) = \gamma^\top [\varphi_\theta(w) \otimes \varphi_\xi(a)] = \gamma^\top \begin{bmatrix} \varphi_{\theta,1}(w)\varphi_{\xi,1}(a) \\ \varphi_{\theta,1}(w)\varphi_{\xi,2}(a) \\ \vdots \\ \varphi_{\theta,2}(w)\varphi_{\xi,1}(a) \\ \vdots \end{bmatrix}$$

Assume we have:

- output proxy NN features $\varphi_\theta(w)$
- treatment NN features $\varphi_\xi(a)$
- linear final layer γ

(argument of feature map indicates feature space)



NN for link $h_y(a, w)$

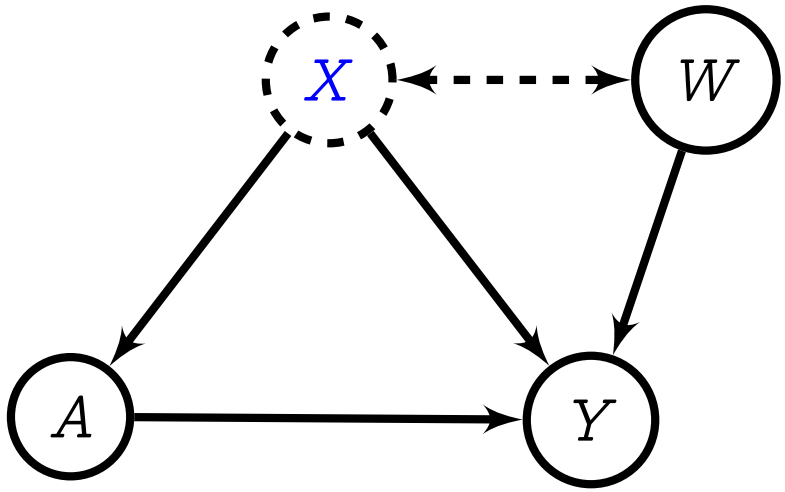
The link function is a function of two arguments

$$h_y(a, w) = \gamma^\top [\varphi_\theta(w) \otimes \varphi_\xi(a)]$$

Assume we have:

- output proxy NN features $\varphi_\theta(w)$
- treatment NN features $\varphi_\xi(a)$
- linear final layer γ

(argument of feature map indicates feature space)



Questions:

- Why feature map $\varphi_\theta(w) \otimes \varphi_\xi(a)$?
- Why final linear layer γ?

Both are necessary (next slide)!

NN ridge regression for $\mathbb{E}_{W|a,z}\varphi_\theta(W)$

Secondary regression: learn NN features $\varphi_\zeta(Z)$ and linear layer F:

$$\mathbb{E}_{W|a,z}\varphi_\theta(W) = \hat{F}_{\theta,\zeta}\varphi_\zeta(a,z)$$

with RR loss

$$\mathbb{E}_{W,A,Z}\|\varphi_\theta(W) - F\varphi_\zeta(A,Z)\|^2 + \lambda_1\|F\|^2$$

$\hat{F}_{\theta,\zeta}$ in closed form wrt $\varphi_\theta, \varphi_\zeta$.

Key point: features $\varphi_\theta(W)$ learned specially for:

$$\mathbb{E}(Y|a, z) = \mathbb{E}_{W|a,z} h_y(W, a)$$

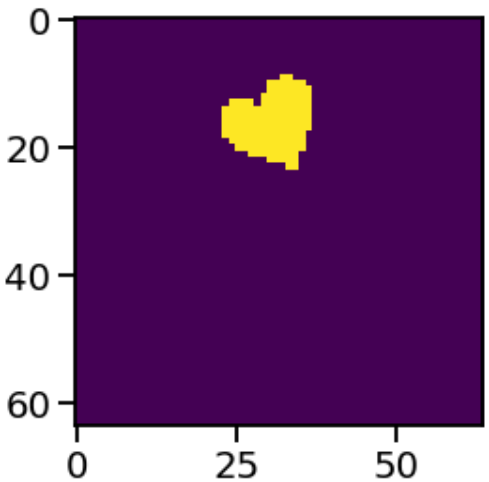
Contrast with autoencoders/sampling: must reconstruct/sample all of W.

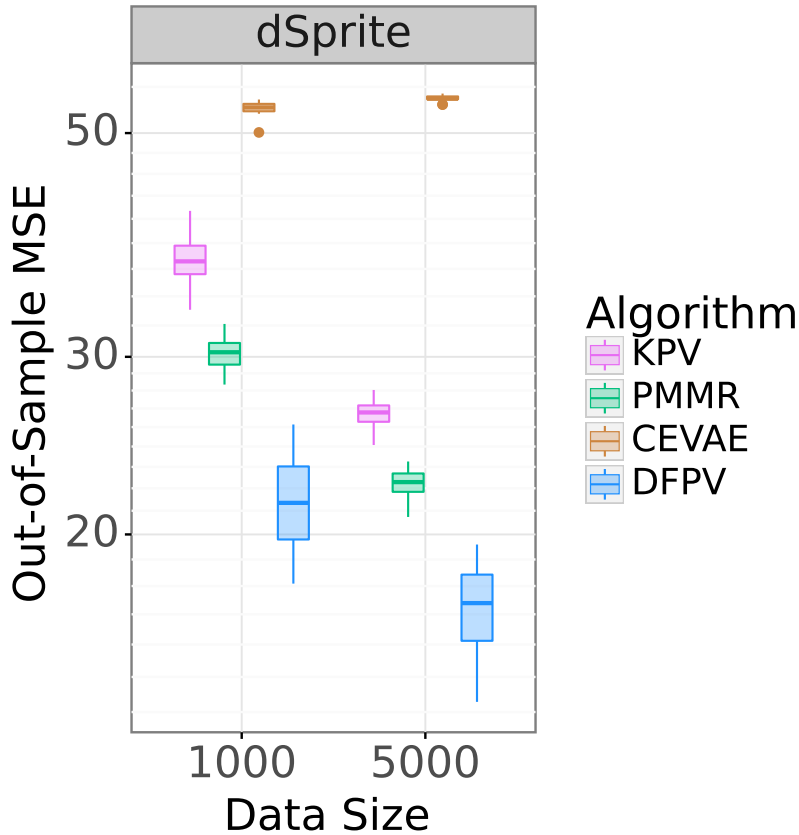
Experiments

Synthetic experiment, adaptive neural net features

dSprite example:

- $X = \{\texttt{scale}, \texttt{rotation}, \texttt{posX}, \texttt{posY}\}$
- Treatment A is the image generated (with Gaussian noise)
- Outcome Y is quadratic function of A with multiplicative confounding by $\texttt{posY}$.
- $Z = \{\texttt{scale}, \texttt{rotation}, \texttt{posX}\}$, $W =$ noisy image sharing $\texttt{posY}$
- Comparison with CEVAE (Louzios et al. 2017)



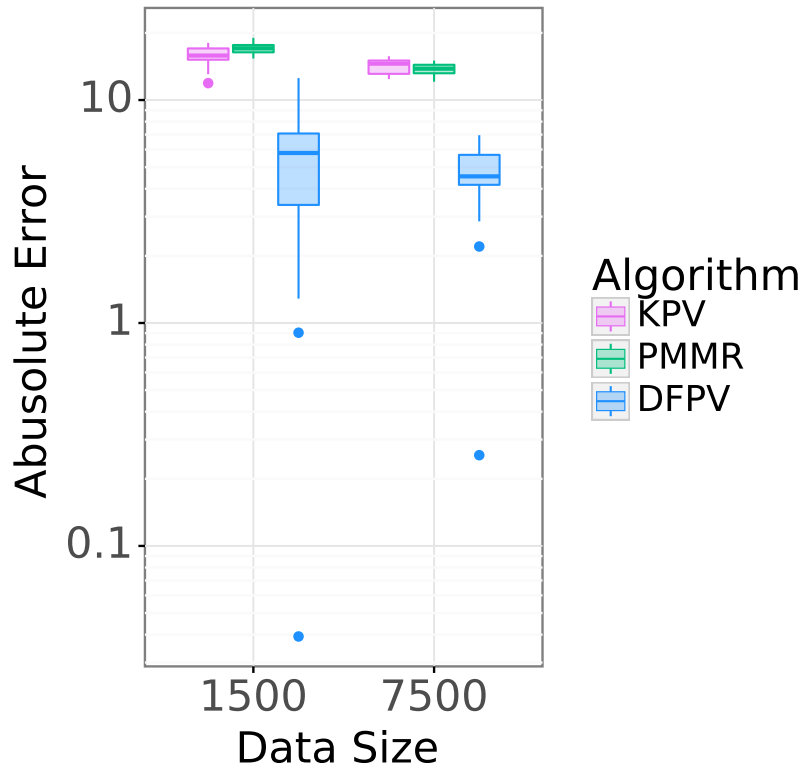


Louizos, Shalit, Mooij, Sontag, Zemel, Welling, Causal Effect Inference with Deep Latent-Variable Models (2017)

Confounded offline policy evaluation

Synthetic dataset, demand prediction for flight purchase.

- Treatment A is ticket price.
- Policy $A \sim \pi(Z)$ depends on fuel price.



Conclusions

Neural net and kernel solutions:

- ...for ATE, CATE, dynamic treatment effects
- ...even for unobserved covariates/confounders (IV and proxy methods)
- ...with treatment A, covariates X, V, proxies/instruments (W, Z) multivariate, "complicated"
- Convergence guarantees for kernels and NN

Key messages:

- Don't ~~meet your heroes~~ model/sample hidden variables
- "Ridge regression is all you need"
