Stein's Method for Stationary Distributions of Markov Chains and Application to Ising Models

Guy Bresler and Dheeraj Nagaraj; Gesine Reinert and Nathan Ross

Arthur Gretton's notes

March 20, 2018

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio

Summary

Tasks

- In continuous spaces, we can define a Stein operator which makes expectations zero under some distribution *P*. We use this to compare to a model without normalising
- Can we do the same for distributions on discrete spaces?

Why should we care?

- Test goodnes of fit for complicated models in discrete spaces (MRFs)
 - application to speech and text modelling
- Can we guarantee that a simple model is "close" to a more complex one (and in what sense)?

- 4 同 6 4 日 6 4 日 6

The basic result

Consider the vector $x \in \{-1, 1\}^n$.

Define reference probability μ and candidate probability ν . Write

 $\mu_i(\cdot|x^{(\sim i)})$

the conditional probability of the *i*th entry given the remaining coordinate values $x^{(\sim i)}$.

The basic result is:

$$|E_{\mu}f - E_{\nu}f| \leq E_{\nu}\left(\frac{1}{n}\sum_{i=1}^{n}\alpha_{i}(f,\mu)\left|\mu_{i}(1|x^{(\sim i)}) - \frac{\nu_{i}(1|x^{(\sim i)})\right|\right)$$

for any function $f : \mathcal{X} \to \mathbb{R}$.

- Comparing conditional probabilities easier than comparing full probabilities.
- The challenge: what is $\alpha_i(f, \mu)$?

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distribution

・ロト (四) (日) (日) (日) (日)

Proof of the basic result: preliminaries

Define the *Glauber dynamics* P with respect to μ , and Q with respect to ν .

• This refers to a Gibbs sampler where you randomly pick which coordinate *i* to sample

Proof of the basic result: preliminaries

Define the *Glauber dynamics* P with respect to μ , and Q with respect to ν .

• This refers to a Gibbs sampler where you randomly pick which coordinate *i* to sample

We are able to define a function h associated with μ and f as

$$h - Ph = (I - P)h = f - E_{\mu}f$$

(the Poisson equation). The Stein operator is (I - P).

Proof of the basic result: preliminaries

Define the *Glauber dynamics* P with respect to μ , and Q with respect to ν .

• This refers to a Gibbs sampler where you randomly pick which coordinate *i* to sample

We are able to define a function h associated with μ and f as

$$h - Ph = (I - P)h = f - E_{\mu}f$$

(the Poisson equation). The Stein operator is (I - P). By definition of the transition operator,

$$E_{\mu}(h-Ph)=0$$

Solving for *h*,

$$\mathbf{h} = (I - P)^{\dagger} (f - E_{\mu} f),$$

where we use the pseudoinverse.

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distribution

By definition of the Gibbs transition,

 $E_{\nu}h = E_{\nu}Qh.$

Therefore

$$E_{\nu}f - E_{\mu}f = E_{\nu}(f - E_{\mu}f)$$

Guy Bresler and Dheeraj Nagaraj; GesineStein's Method for Stationary Distribution

(日) (同) (三) (三)

By definition of the Gibbs transition,

 $E_{\nu}h = E_{\nu}Qh.$

Therefore

$$E_{\nu}f - E_{\mu}f = E_{\nu}(f - E_{\mu}f)$$
$$= E_{\nu}(h - Ph)$$

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio

By definition of the Gibbs transition,

 $E_{\nu}h = E_{\nu}Qh.$

Therefore

$$E_{\nu}f - E_{\mu}f = E_{\nu}(f - E_{\mu}f)$$
$$= E_{\nu}(h - Ph)$$
$$= E_{\nu}(Qh - Ph)$$

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distribution

(日) (同) (三) (三)

Write $x^{i,+1}$ as the vector with *i*th coordinate set to 1. Then

$$Qh - Ph$$

$$= \frac{1}{n} \sum_{i=1}^{n} \left(h(x^{i,+1}) \nu_i(1|x^{(\sim i)}) - h(x^{i,-1}) \nu_i(-1|x^{(\sim i)}) - h(x^{i,+1}) \mu_i(1|x^{(\sim i)}) - h(x^{i,-1}) \mu_i(-1|x^{(\sim i)}) \right)$$

$$= \frac{1}{n} \sum_{i=1}^{n} \Delta_i(h) \left(\nu_i(1|x^{(\sim i)}) - \mu_i(1|x^{(\sim i)}) \right)$$

where we denote the *i*th "derivative" as

$$\Delta_i(h) = h(x^{(i,+)}) - h(x^{(i,-)}).$$

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─臣 ─の�?

Therefore by the above results and triangle inequality,

$$|E_{\mu}f - E_{\nu}f| \le E_{\nu}\left(\frac{1}{n}\sum_{i=1}^{n}|\Delta_{i}(h)|\left|\mu_{i}(1|x^{(\sim i)}) - \frac{\nu_{i}(1|x^{(\sim i)})}{\nu_{i}(1|x^{(\sim i)})}\right|\right)$$

.

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio March 20, 2018

The advanced result

Assume P is α -contractive: given two independent X_t , Y_t with transition P, and $\alpha \in [0, 1)$,

$$E\left[d_h(X_t, Y_t)|X_0=x|Y_0=y\right] \leq \alpha^t d_H(x, y).$$

Assume a smooth f:

$$f(X_t) - f(Y_t) \leq Ld_H(X_t, Y_t).$$

▲日▼ ▲冊▼ ▲目▼ ▲目▼ 目 ろの⊙

The advanced result

Assume P is α -contractive: given two independent X_t , Y_t with transition P, and $\alpha \in [0, 1)$,

$$E\left[d_h(X_t, Y_t)|X_0=x|Y_0=y\right] \leq \alpha^t d_H(x, y).$$

Assume a smooth f:

$$f(X_t) - f(Y_t) \leq Ld_H(X_t, Y_t).$$

The advanced result is:

$$|E_{\mu}f - E_{\nu}f| \leq \frac{L}{1-\alpha}E_{\nu}\left(\frac{1}{n}\sum_{i=1}^{n}\left|\mu_{i}(1|x^{(\sim i)}) - \nu_{i}(1|x^{(\sim i)})\right|\right)$$

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio

Recall the definition

$$h = (I - P)^{\dagger}(f - E_{\mu}f).$$

A more interpretable way to write this is:

$$h(x) = \sum_{t=0}^{\infty} E[f(X_t) - E_{\mu}f|X_0 = x].$$

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio

Using the new expression for h(x),

$$\Delta_{i}h(x) = \sum_{t=0}^{\infty} E\left[f(X_{t}) - f(Y_{t}) - \underbrace{E_{\mu}f + E_{\mu}f}_{=0} | X_{0} = x^{i,+1}, Y_{0} = x^{i,-1}\right]$$

 $x^{i,+1}$ means *i*th coordinate of x set to +1

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distribution

Using the new expression for h(x),

$$\Delta_{i}h(x) = \sum_{t=0}^{\infty} E\left[f(X_{t}) - f(Y_{t}) - \underbrace{E_{\mu}f + E_{\mu}f}_{=0} | X_{0} = x^{i,+1}, Y_{0} = x^{i,-1}\right]$$
$$\leq \sum_{t=0}^{\infty} E\left[Ld_{H}(X_{t}, Y_{t}) | X_{0} = x, Y_{0} = Y\right]$$

smooth $f(X_t) - f(Y_t) \le Ld_H(X_t, Y_t)$ where Hamming distance

$$d_H(x,y) = \sum_{i=1}^n I_{x^i \neq y^i}.$$

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio March 20, 2018 10 / 11

Using the new expression for h(x),

$$\begin{split} \Delta_i h(x) &= \sum_{t=0}^{\infty} E\left[f(X_t) - f(Y_t) - \underbrace{E_{\mu}f + E_{\mu}f}_{=0} | X_0 = x^{i,+1}, Y_0 = x^{i,-1} \right] \\ &\leq \sum_{t=0}^{\infty} E\left[Ld_{\mathcal{H}}(X_t, Y_t) | X_0 = x, Y_0 = Y \right] \\ &\leq L \sum_{t=0}^{\infty} \alpha^t \end{split}$$

using the α -contractive property

$$E\left[d_h(X_t, Y_t)|X_0 = x|Y_0 = y\right] \le \alpha^t d_H(x, y).$$

10 / 11

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio March 20, 2018

The result applied to Ising models

Define two Ising models

$$\mu \propto \exp\left(\frac{1}{2} x^\top L x\right) \qquad \nu \propto \exp\left(\frac{1}{2} x^\top M x\right)$$

Define the *a*-Lipschitz function class

$$|f(x) - f(y)| \leq \sum_{i=1}^n a_i \mathbb{I}_{x_i \neq y_i} := a^\top \Delta_{x,y}$$

3

11 / 11

March 20, 2018

(different Lipschitz constant a_i for each coordinate i).

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distributio

The result applied to Ising models

Define two Ising models

$$\mu \propto \exp\left(rac{1}{2}x^{ op}Lx
ight) \qquad
u \propto \exp\left(rac{1}{2}x^{ op}Mx
ight)$$

Define the *a*-Lipschitz function class

$$|f(x) - f(y)| \leq \sum_{i=1}^{n} a_i \mathbb{I}_{x_i \neq y_i} := a^{\top} \Delta_{x,y}$$

(different Lipschitz constant a_i for each coordinate i). Then

$$|E_{\pi_L}f - E_{\pi_M}f| \leq \frac{\|a\|_2\sqrt{n}}{2(1 - \|(|L|)\|_2)} \|L - M\|_2.$$

Unfortunately this result may be wrong...

Guy Bresler and Dheeraj Nagaraj; Gesine Stein's Method for Stationary Distribution
